Agenda

- Class 1
  - Module 1: Introduction
  - Module 2: Simple select statements
  - Module 3: Filtering
- Class 2
  - Module 4: Expressions
  - Module 5: Joining
- Class 3
  - Module 5: Joining (Continued)
  - Module 6: Grouping
- Class 4
  - Module 7: Subqueries
  - Module 8: UNION

Module 6:
Grouping

Grouping

- Summarize the data
- Special functions called aggregate
  - COUNT
  - SUM
  - AVG
  - MIN
  - MAX
- Return one row per group

Summary (aggregate) query

CustID	OrderID	Amt
1	101	5
2	102	10
3	103	7

```
SELECT
    COUNT(CustID) AS OrderCount,
    MIN(OrderID) AS FirstOrderID,
    SUM(Amt) SumOfOrders,
    AVG(Amt) AvgAmt
FROM Orders;
```

OrderCount	FirstOrderID	SumOfOrders	AvgAmt
3	101	22	7.33

GROUP BY clause

- Columns in the SELECT list or ORDER BY must be in an aggregate function or in the GROUP BY

- Syntax

SELECT <col1>, <ag function>(<col2>)

FROM <table1>
GROUP BY <col1>

Aggregate Queries

CustID	OrderID	TotalDue
1	1	50
2	2	76
1	3	150
1	4	25
3	5	100
3	6	30
2	7	60
1	8	90

Group by CustID

CustID	OrderID	TotalDue
1	1	50
2	2	76
1	3	150
1	4	25
3	5	100
3	6	30
2	7	60
1	8	90

CustID	OrderID	TotalDue
1	1	50
1	3	150
1	4	25
1	8	90

CustID	OrderID	TotalDue
2	2	76
2	7	60

CustID	OrderID	TotalDue
3	5	100
3	6	30

Apply any aggregate functions: SUM, AVG, COUNT…

CustID	OrderID	TotalDue
1	1	50
2	2	76
1	3	150
1	4	25
3	5	100
3	6	30
2	7	60
1	8	90

CustID	OrderID	TotalDue
1	1	50
1	3	150
1	4	25
1	8	90

COUNT(OrderID) = 4
SUM(TotalDue) =315
MAX(OrderID) = 8

CustID	OrderID	TotalDue
2	2	76
2	7	60

COUNT(OrderID) = 2
SUM(TotalDue) =136
MAX(OrderID) = 7

CustID	OrderID	TotalDue
3	5	100
3	6	30

COUNT(OrderID) = 2
SUM(TotalDue) =130
MAX(OrderID) = 6

Return 1 row per group

CustID	OrderID	TotalDue
1	1	50
2	2	76
1	3	150
1	4	25
3	5	100
3	6	30
2	7	60
1	8	90

CustID	OrderID	TotalDue
1	1	50
1	3	150
1	4	25
1	8	90

CustID	OrderID	TotalDue
2	2	76
2	7	60

CustID	OrderID	TotalDue
3	5	100
3	6	30

CustID	Order Count	Last Order	Total
1	4	8	315
2	2	7	136
3	2	6	130

SELECT CustID, COUNT(*) AS [Order Count], MAX(OrderID) AS [Last Order], SUM(TotalDue) AS Total
FROM Sales
GROUP BY CustID

DEMO: GROUP BY

Lab

- Complete Module 6 Lab 1

HAVING

- Use to filter the groups using an aggregate function
- Use WHERE to filter rows
- Use HAVING to filter groups
Return 1 row per group

CustID	OrderID	TotalDue
1	1	50
2	2	76
1	3	150
1	4	25
3	5	100
3	6	30
2	7	60
1	8	90

CustID	OrderID	TotalDue
1	1	50
1	3	150
1	4	25
1	8	90

CustID	OrderID	TotalDue
2	2	76
2	7	60

CustID	OrderID	TotalDue
3	5	100
3	6	30

CustID	Order Count	Last Order	Total
1	4	8	315
2	2	7	136
3	2	6	130

HAVING COUNT(OrderID) > 2

CustID	OrderID	TotalDue
1	1	50
2	2	76
1	3	150
1	4	25
3	5	100
3	6	30
2	7	60
1	8	90

CustID	OrderID	TotalDue
1	1	50
1	3	150
1	4	25
1	8	90

CustID	OrderID	TotalDue
2	2	76
2	7	60

CustID	OrderID	TotalDue
3	5	100
3	6	30

CustID	Order Count	Last Order	Total
1	4	8	315
2	2	7	136
3	2	6	130

CustID	Order Count	Last Order	Total
1	4	8	315

DEMO: HAVING

Lab

- Complete Module 6 Lab 2

Module 7:
Subqueries and Common Table Expressions

IN Subquery

- Use a query to generate a list for the WHERE clause

SELECT <column list>

FROM <schema>.<table1>

WHERE <col> IN (SELECT <col> FROM <schema>.<table2>)

SELECT <column list>

FROM <schema>.<table1>

WHERE <col> NOT IN (SELECT <col> FROM <schema>.<table2>)

DEMO: IN Subquery

Lab

- Complete Module 7 Lab 1

Correlated subquery

- Typically in the SELECT list
- Pull a scalar or single value into a query
- Inner query can see outer query
- Only one column allowed in the subquery
- Often used to separate logic from outer query

Correlated subquery

CustID	OrderID	Amt
1	101	5
2	102	10
1	103	70
3	104	30
2	105	90
1	106	15

```
SELECT
    CustID, OrderID, Amt
FROM Orders AS Ord;
```

CustID	OrderID	Amt	AvgAmt
1	101	5	30
2	102	10	50
1	103	70	30
3	104	30	30
2	105	90	50
1	106	15	30

```
SELECT
    CustID, OrderID, Amt,
    (SELECT AVG(AMT)
     FROM Orders
     WHERE CustID = Ord.CustID ) AS AvgAmt
FROM Orders AS Ord;
```

DEMO: Correlated Subquery

Lab

- Complete Module 7 Lab 2

Derived table

- Subquery in the FROM clause
- Also used to separate the logic
- Join to the subquery
- Outer query can see the columns in the SELECT list
- Often nested

Common table expression (CTE)

- Similar to derived table

- Defined up front

- No nesting, but one CTE can use other CTEs

- Also used to separate logic
- Previous statement MUST end with ;

DEMO: Derived tables and CTEs

Lab

- Complete Module 7 Lab 3

UNION

- Combine the results of two queries

- Rules
  - Same number of columns
  - Compatible data types
  - Names from first query
  - ORDER BY at end

- Also UNION ALL, EXCEPT, and INTERCEPT

UNION – Eliminates Duplicates

Names

ID	Name
1	Kevin
2	Sam
3	Jane
4	Kathi

Customers

CustID	FirstName
100	Bill
120	Denise
130	Anna
4	Kathi

ID	Name
1	Kevin
2	Sam
3	Jane
4	Kathi
100	Bill
120	Denise
130	Anna

SELECT ID, NAME
FROM Names
UNION
SELECT CustID, FirstName
FROM Customers;

UNION ALL – Retains duplicates

Names

ID	Name
1	Kevin
2	Sam
3	Jane
4	Kathi

Customers

CustID	FName
100	Bill
120	Denise
130	Anna
4	Kathi

ID	Name
1	Kevin
2	Sam
3	Jane
4	Kathi
100	Bill
120	Denise
130	Anna
4	Kathi

SELECT ID, NAME
FROM Names
UNION ALL
SELECT CustID, FirstName
FROM Customers;

Except – Find items that don't match

Names

ID	Name
1	Kevin
2	Sam
3	Jane
4	Kathi

Customers

CustID	FName
100	Bill
120	Denise
130	Anna
4	Kathi

ID	Name
1	Kevin
2	Sam
3	Jane

SELECT ID, NAME
FROM Names
EXCEPT
SELECT CustID, FirstName
FROM Customers;

INTERSECT – Find rows that match

Names

ID	Name
1	Kevin
2	Sam
3	Jane
4	Kathi

Customers

CustID	FName
100	Bill
120	Denise
130	Anna
4	Kathi

ID	Name
4	Kathi

SELECT ID, NAME
FROM Names
INTERSECT
SELECT CustID, FirstName
FROM Customers;

Demo: UNION
